Changes

Date	Description
February 11, 2013	Document started
May 09, 2013	Update application requirements

1 Overview

This document will provide functional information users of the end system and persons supporting the system.

For our development our map tiles have stored on an Apache server. The server has also been using Python 2.7 to handle connections with the devices, it does not use any non-standard libraries that do not already come with Python on a standard Ubuntu install.

The Android application running on the devices has a min SDK version or 11, with the target SDK being version 15. The external libraries that were used can be found at <https://code.google.com/p/osmdroid/> (OSMDroid) and <http://www.slf4j.org/android/> (Logger for OSMDroid)
